If you are working on Windows

You will need gcc. I instaled from: http://tdm-gcc.tdragon.net/

if you are working on Mac

You will need to have 'brew' installed - google 'install brew' and then install:

```
brew install gmp openssl llvm
```

Other notes

Also it appears that my original instructions for hw-5 are missing the –addr parameter that you have to use when validating a signature.

Linking probblem

You have to delete a package from go-ethereum

In /Users/ `Your User Name` /go/src/github.com/ethereum/go-ethereum/vendor/github.com and in /Users/ `Your User Name` /go/src/github.com/Univ-Wyo-Education/Blockchain-4010-Fall-2018/vendor/github.com

find the directory `pborman` and remove the `uuid` package. That is the directory under `pborman` .

Then verify that you have this package in `~/go/src/github.com/pborman/uuid` – to do that create the directory `~/go/src/github.com/pborman` cd to it, then

```
go get https://github.com/pborman/uuid.git
```
